# Pengenalan

---

AJAX ialah satu elemen penting dalam pembangunan Web 2.0. Dalam tutorial kali ini, kita akan mempelajari setiap CakePHP Ajax Method

## Prototype

- link
- remoteFunction
- remoteTimer
- form
- submit
- observeField
- observeForm
- autoComplete

## ScriptAculoUs Effects

# Installation & Setup

1. Install Xampplite di **c:\xampplite**
2. Bina database bernama **cake** menggunakan phpMyAdmin
3. Download dan Install CakePHP versi 1.3.3 Stable URL :  
<http://github.com/cakephp/cakephp/downloads>
4. Extract supaya fail cakephp terletak di **c:\xampplite\htdocs\cakephp\**
5. Tulis kod di bawah dan simpan di dalam **c:\Windows\cake.bat**

```

1 @echo.
2 @echo off
3 SET app=%0
4 SET lib=c:\xampplite\htdocs\cakephp\cake\console\
5 SET php=c:\xampplite\php\php.exe -q
6 %php% "%lib%cake.php" -working "%CD%" %*
7 echo.

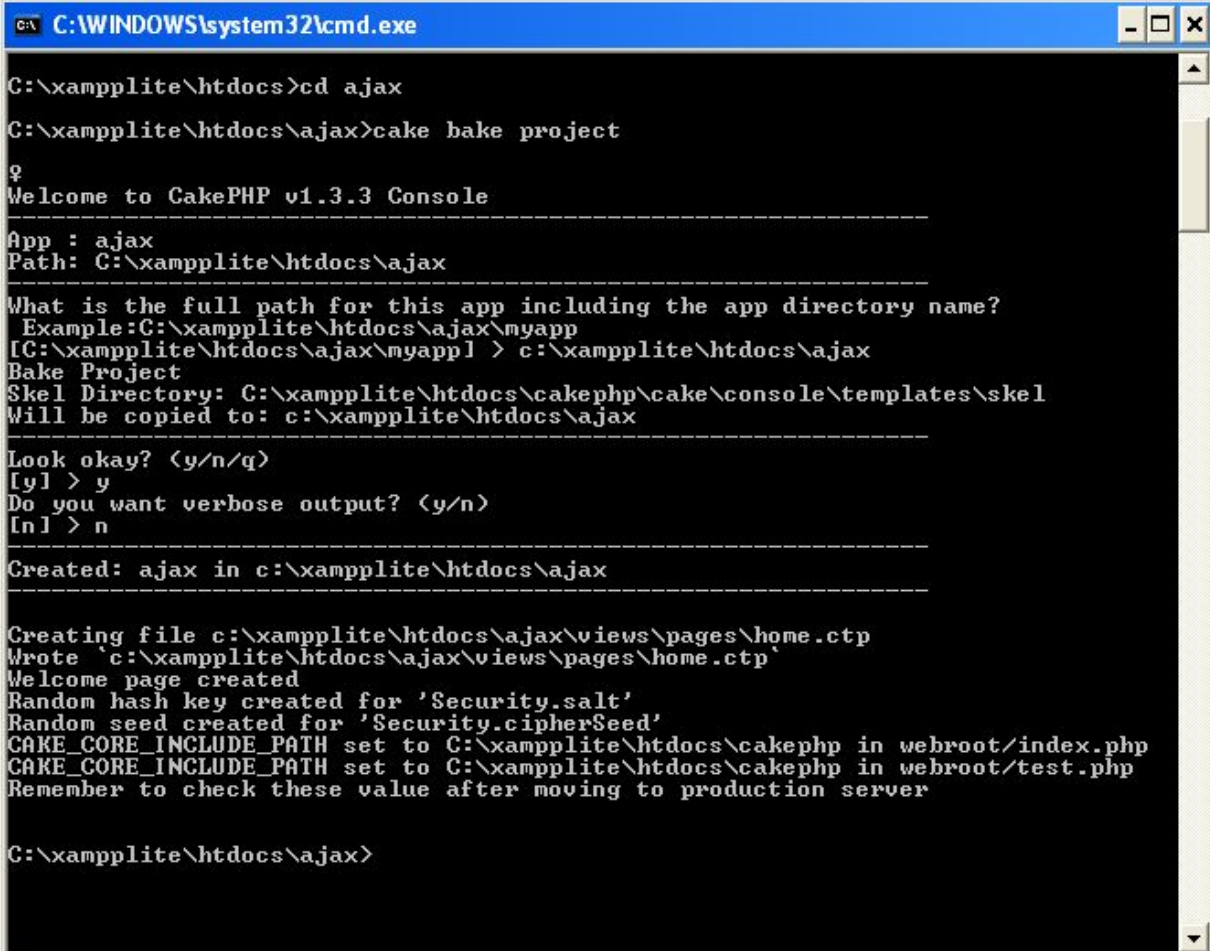

```

Save sebagai c:\windows\cake.bat

Lokasi fail CakePHP 1.3

# Cake bake project ajax

```
C:\WINDOWS\system32\cmd.exe

C:\xampplite\htdocs>cd ajax
C:\xampplite\htdocs\ajax>cake bake project
?
Welcome to CakePHP v1.3.3 Console
-----
App : ajax
Path: C:\xampplite\htdocs\ajax
-----
What is the full path for this app including the app directory name?
Example:C:\xampplite\htdocs\ajax\myapp
[C:\xampplite\htdocs\ajax\myapp] > c:\xampplite\htdocs\ajax
Bake Project
Skel Directory: C:\xampplite\htdocs\cakephp\cake\console\templates\skel
Will be copied to: c:\xampplite\htdocs\ajax
-----
Look okay? <y/n/q>
[yl] > y
Do you want verbose output? <y/n>
[lnl] > n
-----
Created: ajax in c:\xampplite\htdocs\ajax
-----

Creating file c:\xampplite\htdocs\ajax\views\pages\home.ctp
Wrote 'c:\xampplite\htdocs\ajax\views\pages\home.ctp'
Welcome page created
Random hash key created for 'Security.salt'
Random seed created for 'Security.cipherSeed'
CAKE_CORE_INCLUDE_PATH set to C:\xampplite\htdocs\cakephp in webroot/index.php
CAKE_CORE_INCLUDE_PATH set to C:\xampplite\htdocs\cakephp in webroot/test.php
Remember to check these value after moving to production server

C:\xampplite\htdocs\ajax>
```

Bina project di c:\xampplite\htdocs\ajax

# Examples Controller

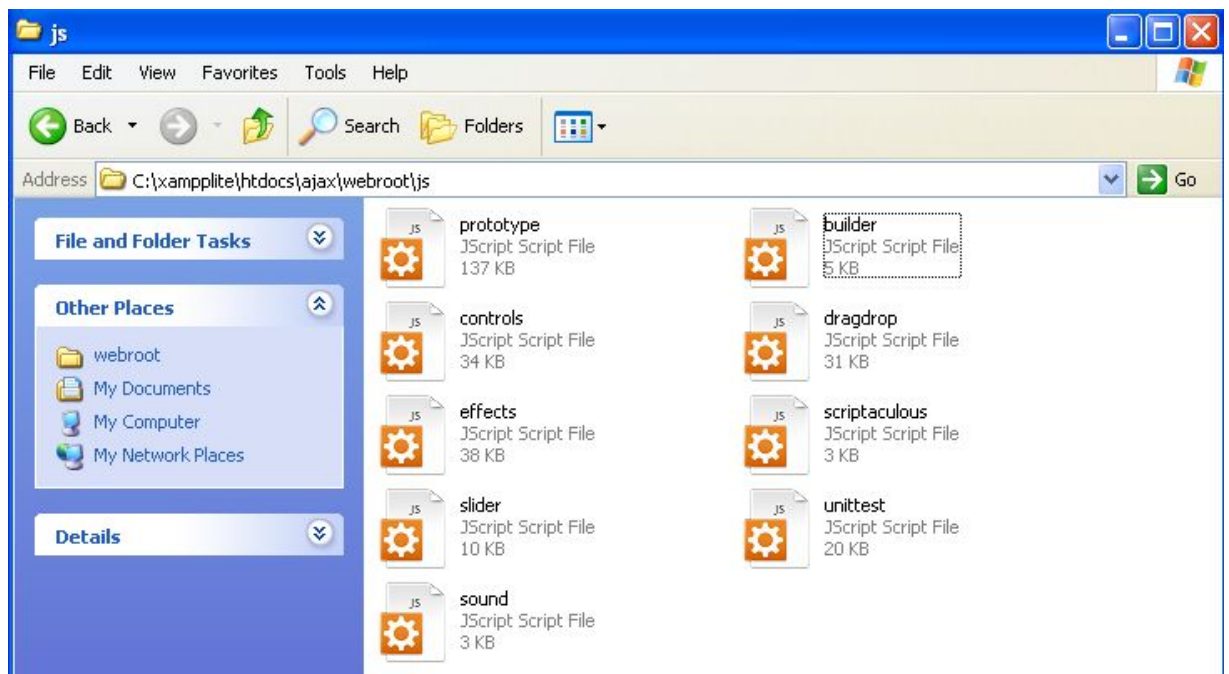

1. Buat satu controller bernama Examples di APP/controllers/examples\_controller.php dan letak kod di bawah :

```

1  <?php
2  class ExamplesController extends AppController {
3      var $name = 'Examples';
4      var $uses = null;
5
6      function index() {
7      }
8  }
```

Baris 4, var \$uses = null digunakan kerana ExamplesController tidak menggunakan Model

2. Bina folder APP/views/examples/
3. Cipta fail kosong dan save sebagai APP/views/examples/index.ctp
4. Download <http://prototypejs.org/assets/2009/8/31/prototype.js> dan save ke APP/webroot/js/prototype.js
5. Download <http://script.aculo.us/dist/scriptaculous-js-1.8.3.zip> dan extract ke folder APP/webroot/js/

## Update default.ctp

Ubah fail APP/views/layouts/default.ctp dan tambah kod di bawah

```

28 <?php
29     echo $this->Html->meta('icon');
30
31     echo $this->Html->css('cake.generic');
32
33     echo $this->Html->script('prototype');
34
35     echo $this->Html->script('scriptaculous');
36
37     echo $scripts_for_layout;
38 ?>

```

Baris ke 33 dan 35 akan load script **prototype.js** dan **scriptaculous.js**

## Ajax Link

Sekarang kita sudah boleh menggunakan AJAX dalam sistem

Untuk membolehkan AJAX berfungsi, kita perlu enablekan Ajax Helper dan RequestHandler Component di dalam ExamplesController

```

1 <?php
2 class ExamplesController extends AppController {
3     var $name = 'Examples';
4     var $uses = null;
5     var $helpers = array('Ajax');
6     var $components = array('RequestHandler');
7
8     function index(){
9     }
10
11    function get_link(){
12        $this->autoRender = false;
13        echo 'http://azrilnazli.blogspot.com';
14    }
15 }

```

Action `get_link()` berfungsi untuk memberi data menggunakan AJAX. Baris 12, `$this->autoRender = FALSE` digunakan untuk memberitahu CakePHP supaya tidak render view secara automatik. Seterusnya ubah fail **APP/views/examples/index.ctp**

```

1  <?php
2  $example1 = $ajax->link(
3      $title   = 'Ajax Link', // link title
4      $url     = '/examples/get_link', // link url
5      $options = array( 'update' => 'show_link' ) // DOM ID
6  );
7  ?>
8
9  <table style="width:900px">
10     <tr>
11         <th style="width:300px">Link</th>
12         <th style="width:50px">Loader</th>
13         <th style="width:650px">Result</th>
14     </tr>
15
16     <tr>
17         <td><?php echo $example1; ?></td>
18         <td></td>
19         <td>
20             <div id="show_link"></div>
21         </td>
22     </tr>
23 </table>

```

Kod untuk APP/views/examples/index.ctp

Link	Loader	Result
<a href="#">Ajax Link</a>		http://azrilnazli.blogspot.com

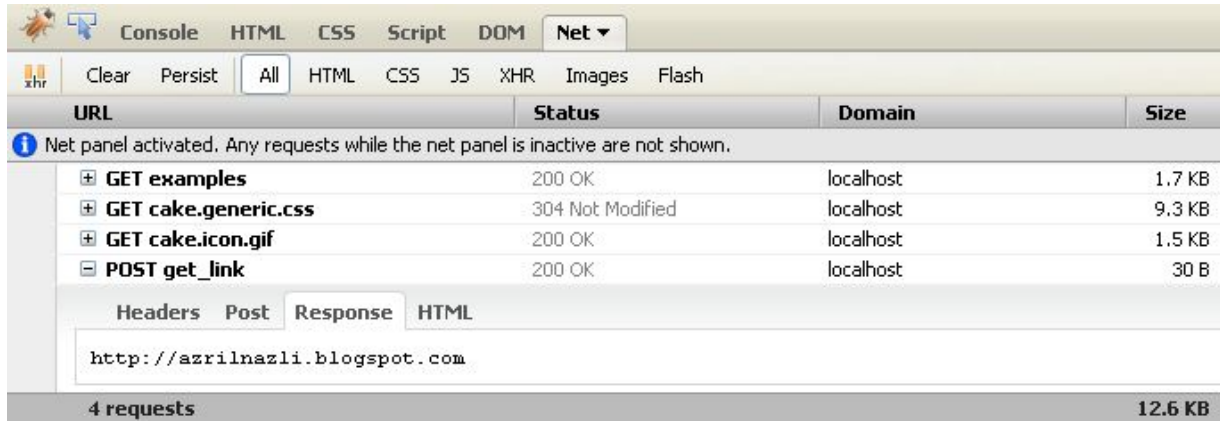

Cuba buka alamat <http://localhost/ajax/examples> dan klik Ajax Link, di coumn Result akan dipaparkan nilai data yang dihantar oleh action **get\_link()**

Kini anda telah berjaya menghasilkan Ajax Link yang mudah.

# Firebug

Jika anda menggunakan Mozilla Firefox dengan Firebug Plugin, coba lihat data yang di hantar dalam tab Response

The screenshot shows the Firebug Net panel with the following data:

URL	Status	Domain	Size
Net panel activated. Any requests while the net panel is inactive are not shown.			
GET examples	200 OK	localhost	1.7 KB
GET cake.generic.css	304 Not Modified	localhost	9.3 KB
GET cake.icon.gif	200 OK	localhost	1.5 KB
POST get_link	200 OK	localhost	30 B

Below the table, the 'Response' tab is selected, showing the URL: `http://azrilnazli.blogspot.com`.

At the bottom, a summary bar indicates: **4 requests** and **12.6 KB**.

Jika link diklik, methd POST digunakan, dan response yang dikembalikan ialah apa yang dipaparkan dalam column Result.

. Untuk install Firebug, sila download di <http://getfirebug.com>

## Ajax Link : Output Image

Seterusnya, mari kita cuba hantar response untuk paparkan gambar.

```

16 function get_image(){
17     $this->autoRender = false;
18     App::import('Helper','Html');
19     $html = new HtmlHelper();
20     echo $html->image('cake.power.gif');
21 }

```

Tambah action get\_image() dalam ExamplesController

```

9 // link output image
10 $example2 = $ajax->link(
11     $title = 'Ajax Link output image', // link title
12     $url = '/examples/get_image', // link url
13     $options = array( 'update' => 'show_image' ) // DOM ID
14 );

```

Tambah kod \$example2 dalam APP/views/examples/index.ctp. Kodnya lebih kurang sama dengan \$example1 Cuma ubah nilai variable \$url sahaja dan update ke DOM ID = show\_image

```

34 <tr>
35     <td><?php echo $example2; ?></td>
36 <td></td>
37 <td>
38     <div id="show_image"></div>
39 </td>
40 </tr>

```

Tambah kod untuk paparkan \$example2 di dalam Table.

Link	Loader	Result
<a href="#">Ajax Link</a>		http://azrilnazli.blogspot.com
<a href="#">Ajax Link output image</a>		

Buka alamat <http://localhost/ajax/examples/index.ctp> dan cuba klik **Ajax Link output image**. Gambar logo CakePHP akan terpapar di bahagian Result

# Ajax Options

Option keys	Description
<code>\$options['evalScripts']</code>	Determines if script tags in the returned content are evaluated. Set to <i>true</i> by default.
<code>\$options['frequency']</code>	The number of seconds between interval based checks.
<code>\$options['indicator']</code>	The DOM id of an element to show while a request is loading and to hide when a request is completed.
<code>\$options['position']</code>	To insert rather than replace, use this option to specify an insertion position of <i>top</i> , <i>bottom</i> , <i>after</i> , or <i>before</i> .
<code>\$options['update']</code>	The id of the DOM element to be updated with returned content.
<code>\$options['url']</code>	The url of the controller/action that you want to call.
<code>\$options['type']</code>	Indicate whether the request should be 'synchronous' or 'asynchronous' (default).
<code>\$options['with']</code>	A URL-encoded string which will be added to the URL for get methods or in to the post body for any other method. Example: <code>x=1&amp;foo=bar&amp;y=2</code> . The parameters will be available in <code>\$this-&gt;params['form']</code> or available in <code>\$this-&gt;data</code> depending on formatting. For more information see the <a href="#">Prototype.Serialize</a> method.

Rajah di atas adalah nilai-nilai \$options yang digunakan untuk menghasilkan skrip Ajax. Buat masa ini, kita baru menggunakan :

- indicator
- update
- url

# Ajax Link : Hantar Variable POST & GET

Bagaimana untuk menghantar variable menggunakan Ajax ? Contohnya untuk passing nilai ID ?

```

23 function get_params() {
24     $this->autoRender = false;
25     debug($this->params['form']);
26 }

```

Tambah action get\_params() dalam Examples Controller

```

29 // simple link with parameter
30 $example4 = $ajax->link(
31     $title    = 'Ajax Link with params', // link title
32     $url      = '/examples/get_params', // link url
33     $options  = array(
34         'update' => 'show_link_param', // result dom id
35         'indicator' => 'loader_param', // loader dom id
36         'with' => "'title=Website Saya&url=http://azrilnazli.blogspot.com'",
37     )
38 );

```

Tambah \$example4 dalam fail APP/views/examples/index.ctp. Perhatikan line 36, kita menggunakan \$options['with'] untuk hantar variable.

Link	Loader	Result
<a href="#">Ajax Link</a>		
<a href="#">Ajax Link output image</a>		
<a href="#">Ajax Link with loader</a>		
<a href="#">Ajax Link with params</a>		ajax\controllers\examples_controller.php (line 25) <pre> Array (     [title] =&gt; Website Saya     [url] =&gt; http://azrilnazli.blogspot.com ) </pre>

Buka /examples/index menggunakan browser dan klik **Ajax Link with Params**. Parameter telah berjaya dihantar ke action get\_params() dan boleh diakses menggunakan array \$this->params['form']

Anda juga boleh access data yang dihantar menggunakan \$\_POST kerana Ajax Link menghantar data menggunakan http POST,

```

23 function get_params() {
24     $this->autoRender = false;
25     #debug($this->params['form']);
26     debug($_POST);
27 }

```

Advanced CakePHP : CakePHP Ajax Registration Form

Alternatif lain untuk menghantar data, boleh guna cara di bawah

```

29 // simple link with parameter
30 $example4 = $ajax->link(
31     $title    = 'Ajax Link with params', // link title
32     $url      = array(
33         'action' => 'get_params',
34         'title'  => 'Website Saya',
35         'url'    => 'azrilnazli.blogspot.com'
36     ),
37     $options  = array(
38         'update' => 'show_link_param', // result dom id
39         'indicator' => 'loader_param', // loader dom id
40         //'with' => "'title=Website Saya&url=http://azrilnazli.blogspot.com'",
41     )
42 );

```

Data akan dihantar mengikut format CakePHP dan untuk mengaksesnya , perlu menggunakan array `$this->passedArgs` di dalam Controller,

```

23 function get_params(){
24     $this->autoRender = false;
25     #debug($this->params['form']);
26     #debug($_POST);
27     debug($this->passedArgs);
28 }

```

#### Ajax Link with params

ajax\controllers\examples\_controller.php (line 27)

```

Array
(
    [title] => Website Saya
    [url] => azrilnazli.blogspot.com
)

```

Hasil debug(\$this->passedArgs);

## Ajax Link : Update Multiple DIVs

Ada situasi di mana anda perlu update beberapa posisi div. Mungkin DIV1 untuk paparkan status seperti 'Updated,Failed' dan DIV 2 paparkan nilai yang dihantar oleh Controller.

Letak kod berikut di dalam ExamplesController

```

30      # APP/views/examples/two_divs.ctp
31      function two_divs(){
32          $content['first']    = 'first div ';
33          $content['second']   = 'second div ';
34          $this->set(compact('content'));
35      }

```

APP/controllers/examples\_controller.php

Cipta VIEW untuk action two\_divs() dan save sebagai APP/views/.examples/two\_divs.ctp

```

1  <?php
2  # first div
3  echo $ajax->div('first');
4      echo $content['first'];
5  echo $ajax->divEnd('first');
6
7  # second div
8  echo $ajax->div('second');
9      echo $content['second'];
10 echo $ajax->divEnd('second');
11 ?>

```

Pastikan nama div sama dengan nama div yang ingin di update dalam index.ctp.

Buka fail APP/views/examples/index.ctp dan letak kod di bawah,

```

44 // multiple divs Update
45 $example5 = $ajax->link(
46     $title    = 'Multiple DIVs Update', // link title
47     $url      = array(
48         'action' => 'two_divs',
49     ),
50     $options  = array(
51         'update' => array('first','second'), // multiple in array
52         'indicator' => 'loader_multiple', // loader dom id
53     )
54 );
55

```

Baris ke 51 menunjukkan saya menggunakan array() untuk memberi nilai DIV yang akan diupdate. Pastikan nama DIV sama dengan nilai di dalam fail APP/views/examples/two\_divs.ctp.

```

106 <tr>
107     <td><?php echo $example5; ?></td>
108     <td>
109         <div id="loader_multiple" style="display:none">
110             <?php echo $this->Html->image('loader.gif'); ?>
111         </div>
112     </td>
113     <td>
114         <div id="first" style="color:red"></div>
115         <div id="second" style="color:green"></div>
116     </td>
117 </tr>

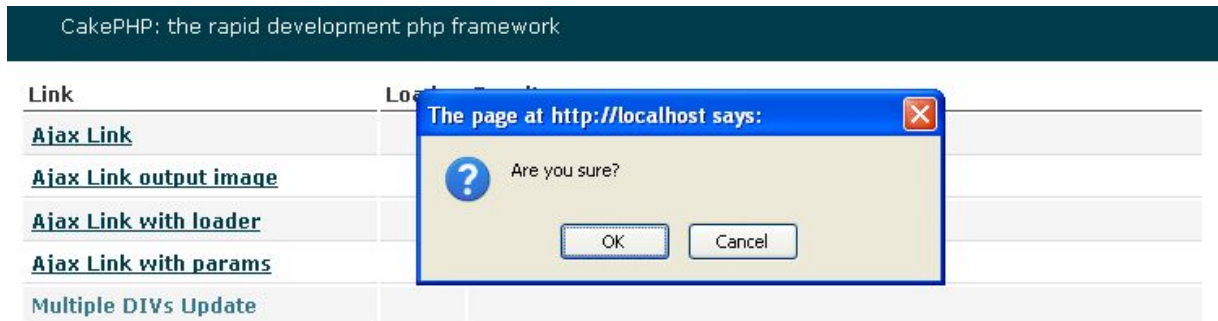

```

Tambah row untuk Example 5. Perhatikan baris 114 dan 115. Nama DOM ID ialah first dan second dan warna berlainan diberi dalam CSS.

Link	Loader	Result
<a href="#">Ajax Link</a>		
<a href="#">Ajax Link output image</a>		
<a href="#">Ajax Link with loader</a>		
<a href="#">Ajax Link with params</a>		
<a href="#">Multiple DIVs Update</a>		first div second div

Buka browser dan hasilnya adalah seperti di atas. Nilai untuk DIV=first berwarna merah dan DIV=second berwarna hijau.

## Ajax Link Confirmation box

Bagaimana jika kita ingin confirmation box seperti di atas ?

```

44 // multiple divs Update
45 $example5 = $ajax->link(
46     $title    = 'Multiple DIVs Update', // link title
47     $url      = array(
48         'action' => 'two_divs',
49     ),
50     $options  = array(
51         'update' => array('first','second'), // multiple in array
52         'indicator' => 'loader_multiple', // loader dom id
53     ),
54     $confirm  = 'Are you sure? ' // confirmation box
55 );

```

Kemaskini kod untuk Example 5, sila tambah baris 54.

## Ajax Remote Function

Fungsi ini hampir sama dengan \$ajax->link, contohnya anda ingin update status, dapatkan data dengan menggunakan Javascript method seperti onClick on MouseOver

```

37 function get_time(){
38     $this->autoRender = false;
39     App::import('Helper','Time');
40     $time = new TimeHelper();
41     echo $time->nice(time());
42 }

```

Tambah a action get\_time() dalam Examples Helper, fungsi ini akan memberikan nilai waktu terkini

```

58 // remote function
59 $example6 = $ajax->remoteFunction(
60     array(
61         'url' => array( 'action' => 'get_time' ),
62         'indicator' => 'loader_example6', // loader dom id
63         'update' => 'example6' )
64 );

```

Tambah kod \$example5 dalam APP/views/examples/index.ctp

```

129 <tr>
130     <td><?php echo $form->button('Get Time', array('onclick' => $example6 ) ); ?></td>
131     <td>
132         <div id="loader_example6" style="display:none">
133             <?php echo $this->Html->image('loader.gif'); ?>
134         </div>
135     </td>
136     <td>
137         <div id="example6"></div>
138     </td>
139 </tr>

```

Tambah kod HTML untuk Example 6, APP/views/examples/index.ctp

Link	Loader	Result
<a href="#">Ajax Link</a>		
<a href="#">Ajax Link output image</a>		
<a href="#">Ajax Link with loader</a>		
<a href="#">Ajax Link with params</a>		
<a href="#">Multiple DIVs Update</a>		
<input type="button" value="Get Time"/>		Sat, Aug 21st 2010, 11:18

## Ajax Remote Timer

Fungsi ini akan update DOM ID mengikut timer dalam kiraan saat. Contohnya anda membuat satu sistem untuk update jumlah user yang online pada masa yang ditentukan. Contoh di bawah akan update masa terkini setiap 5 saat.

```

67 // remote timer
68 $example7 = $ajax->remoteTimer(
69     array(
70         'url' => array( 'action' => 'get_time' ),
71         'indicator' => 'loader_example7', // loader dom id
72         'frequency' => 5,
73         //'complete' => 'alert( "request completed" )',
74         //'position' => 'bottom',
75         'update' => 'example7',
76     )
77 );

```

frequency bermaksud ajax akan update dalam N saat yang ditentukan.

```

152 <tr>
153     <td>5 secs update <?php echo $example7; ?></td>
154     <td>
155         <div id="loader_example7" style="display:none">
156             <?php echo $this->Html->image('loader.gif'); ?>
157         </div>
158     </td>
159     <td>
160         <div id="example7"></div>
161     </td>
162 </tr>

```

Letak kod HTML container untuk Example 7

<input type="button" value="Get Time"/>	Sat, Aug 21st 2010, 12:19
5 secs update	Sat, Aug 21st 2010, 12:27

Hasil di browser. Setiap 5 saat, Example7 akan update nilai masa

# Ajax Form

Ajax Form berfungsi seperti Form Helper yang normal, cuma datang yang dihantar menggunakan Ajax.

```

44     function example8(){
45         $this->autoRender = false;
46         debug($this->data);
47     }

```

Tulsi kod di atas dalam Examples Controller. Data yang diterima akan diletakkan dalam debug()

```

163     <tr>
164         <td>
165             <?php echo $ajax->form(
166                 $url='example8',
167                 $type = 'post',
168                 $options = array(
169                     'model'=>'Example',
170                     'update'=>'example8',
171                     'indicator' => 'loader_example8',
172                 )
173             ); ?>
174             <?php echo $form->text('title'); ?>
175             <?php echo $form->submit('SEND'); ?>
176             <?php echo $form->end(); ?>
177         </td>
178         <td>
179             <div id="loader_example8" style="display:none">
180                 <?php echo $this->Html->image('loader.gif'); ?>
181             </div>
182         </td>
183         <td>
184             <div id="example8"></div>
185         </td>
186     </tr>

```

Tambah kod di atas dalam Container Example.

**\$type** merujuk kepada cara data di hantar ( post atau get )

**\$options['model']** merujuk kenapa jenis Model data akan disusun, Model.fieldname

ajax\controllers\examples\_controller.php (line 46)

```

Array
(
    [Example] => Array
        (
            [title] => cubaan
        )
)

```

## Ajax Submit

Hampir serupa dengan Ajax Form, tetapi kali ini menggunakan Submit button untuk menghantar data.

```

187 <tr>
188 <td>
189 <?php echo $form->create('Example'); ?>
190 <?php echo $form->text('title'); ?>
191 <?php echo $ajax->submit('Submit', array(
192     'url' => array( 'action' => 'example8' ),
193     'update' => 'example9',
194     'indicator' => 'loader_example9',
195 )
196 ); ?>
197 <?php echo $form->end(); ?>
198 </td>
199 <td>
200 <div id="loader_example9" style="display:none">
201 <?php echo $this->Html->image('loader.gif'); ?>
202 </div>
203 </td>
204 <td>
205 <div id="example9"></div>
206 </td>
207 </tr>

```

Tambah kod di atas dalam Container Example. Kod ini menggunakan kembali action example8()

Submit

**ajax\controllers\examples\_controller.php (line 46)**

```

Array
(
    [Example] => Array
        (
            [title] => test
        )
)

```

Hasil di dalam browser

## Ajax Field Observer

Fungsi ini antara paling banyak digunakan dalam aplikasi. Contoh paling mudah ialah jika anda mempunyai select field untuk pilih negeri, kemudian keluar daerah yang berkaitan

```

54 function get_daerah(){
55     // data from ajax observer
56     switch( $this->data['Example']['negeri'] ){
57         case 1:
58             $options = array('Batu Pahat','Johor Bahru', 'Kluang' );
59             break;
60         case 2:
61             $options = array('Puchong','Dengkil', 'Sepang' );
62             break;
63         case 3:
64             $options = array('Batu Berendam','Ayer Keroh' );
65             break;
66     }
67     // used in APP/views/examples/get_data.ctp
68     $this->set(compact('options'));
69 }

```

Salin kod di atas dalam Examples Controller. Kod ini akan menerima input dari Ajax Field Observer, jika nilai 1, akan menggunakan nilai \$options dalam case 1.

```

1 <?php
2 // display negeri drop down
3 echo $form->input('Example.daerah', array(
4     'type' => 'select',
5     'options' => $options,
6 ));
7 ?>

```

Nilai \$options dalam Examples::get\_daerah() akan digunakan dalam view di dalam fail APP/views/examples/get\_daerah.ctp untuk menunjukkan daerah yang di bawah negeri yang dipilih.

```

209 <tr>
210 <td>
211 <?php echo $form->create('Example'); ?>
212 <?php $options = array(
213     '1' => 'Johor',
214     '2' => 'Selangor',
215     '3' => 'Melaka',
216 );
217 echo $form->input('negeri', array(
218     'type' => 'select',
219     'options' => $options,
220     'id' => 'my_state'
221 ));
222 ?>
223 <?php echo $form->end(); ?>
224 <?php
225 echo $ajax->observeField('my_state',
226     array(
227         'url' => array('action' => 'get_daerah'),
228         'frequency' => 0.2,
229         'indicator' => 'loader_example10',
230         'update' => 'example10'
231     )
232 );
233 ?>
234 </td>
235 <td>
236 <div id="loader_example10" style="display:none">
237     <?php echo $this->Html->image('loader.gif'); ?>
238 </div>
239 </td>
240 <td>
241 <div id="example10"></div>
242 </td>
243 </tr>

```

Salin kod di atas dalam APP/views/examples/index.ctp dalam container Example.

\$ajax->observeField() akan mengambil nilai DOM ID my\_state. Jika ada perubahan, data tersebut akan dihantar ke action my\_daerah dan kemudiannya akan update DOM ID example10, yang akhirnya akan paparkan dropdown untuk negeri.

The image shows a web browser interface with two dropdown menus. The first dropdown, labeled 'Negeri', has 'Johor' selected. The second dropdown, labeled 'Daerah', has a list of options: 'Batu Pahat', 'Johor Bahru', and 'Kluang'. The 'Batu Pahat' option is currently selected in the 'Daerah' dropdown.

Hasil dalam browser.

 `observeField` uses the same options as `link`

The field to send up can be set using `$options['with']`. This defaults to `Form.Element.serialize('${fieldId}')`. Data submitted is available at `$this->data` inside your controllers. Callbacks can be used with this function.

 To send up the entire form when the field changes use `$options['with'] = Form.serialize( $('FormID') )`

Contoh di atas hanya menghantar 1 field sahaja, jika anda ingin menghantar seluruh form, gunakan `$options['with'] = Form.serialize( $('ExampleIndexForm') )`

## Ajax Observe Form

**`observeForm(string $form_id, array $options)`**

Similar to `observeField()`, but operates on an entire form identified by the DOM id `$form_id`. The supplied `$options` are the same as `observeField()`, except the default value of the `$options['with']` option evaluates to the serialized (request string) value of the form.

# Ajax AutoComplete

AutoComplete memudahkan pengguna kerana sistem akan memberi suggestion/cadangan. Jadi kita akan buat sistem carian nama Contacts. Untuk ini mari kita bina table untuk model Contact. Bina database bernama cake guna phpMyAdmin dahulu

```
C:\WINDOWS\system32\cmd.exe
C:\xampplite\htdocs\ajax>cake bake

Bake All complete

C:\xampplite\htdocs\ajax>

```

Mari bake Contact : cake bake contact

Advanced CakePHP : CakePHP Ajax Registration Form

## Contacts

Id	Name	Email
3	ariana	ariana@localhost
1	azril	azril.nazli@gmail.com
2	borhan	borhan@localhost
4	cek mon	mondok@localhost

Page 1 of 1, showing 4 records out of 4 total, starting on record 1, ending on 4

<< previous | next >>

Buka <http://localhost/ajax/contacts> dan tambah contact anda.

```

71 function get_contacts() {
72     //Partial strings will come from the autocomplete field as
73     //$this->data['Contact']['name']
74     $this->loadModel('Contact');
75     $this->set('contacts', $this->Contact->find('all', array(
76         'conditions' => array(
77             'Contact.name LIKE' => $this->data['Contact']['name'].'%'
78         ),
79         'fields' => array('name', 'email')
80     ));
81 }

```

Tambah action di atas dalam Examples Controller di APP/controllers/examples\_controller.php

```

1 <ul>
2     <?php foreach($contacts as $c): ?>
3         <li><?php echo $c['Contact']['name']; ?></li>
4     <?php endforeach; ?>
5 </ul>

```

Cipta fail APP/views/examples/get\_contacts.ctp

```

245 <tr>
246 <td>
247 <style>
248     div.auto_complete {
249         position      :absolute;
250         width          :250px;
251         background-color :white;
252         border         :1px solid #888;
253         margin         :0px;
254         padding        :0px;
255     }
256     li.selected      { background-color: #ffb; }
257 </style>
258 <?php
259     echo $ajax->autoComplete('Contact.name', '/examples/get_contacts');
260 >?>
261 </td>
262 <td>
263     <div id="loader_example11" style="display:none">
264         <?php echo $this->Html->image('loader.gif'); ?>
265     </div>
266 </td>
267 <td>
268     <div id="example11"></div>
269 </td>
270 </tr>

```

Akhir sekali letak kod di atas dalam container Examples di APP/views/examples/index.ctp

Cuba letak carian a,atau b atau c. Secara automatik Ajax->AutoComplete() akan listkan data berkaitan di bawah.

# Sistem Pendaftaran Menggunakan AJAX

---

Kita akan membina sistem pendaftaran yang mempunyai data seperti di bawah

- Nama penuh
- No Kad Pengenalan
- Alamat
- Daerah
- Negeri
- Negara
- Email
- Laman Web

Ciri-ciri sistem

- Data disimpan dalam table bernama **registrations**
- Data dari NRIC membolehkan data berikut diperoleh :
  1. Jantina
  2. Negeri lahir
  3. Umur
  4. Tarikh Lahir
- Dapatkan nilai koordinat dalam format WGS-84 menggunakan khidmat Geocoding dari Google Map Web Service
- Plotkan semua pengguna menggunakan Google Map
- Nilai Negeri, Daerah dan Negara disusun menggunakan teknik **Tree Behavior**

# Tree Behavior

URL : <http://book.cakephp.org/view/91/Tree>

Behavior ini membolehkan data boleh mempunyai sub-kategori tanpa had menggunakan teknik MPTT (<http://dev.mysql.com/tech-resources/articles/hierarchical-data.html> )

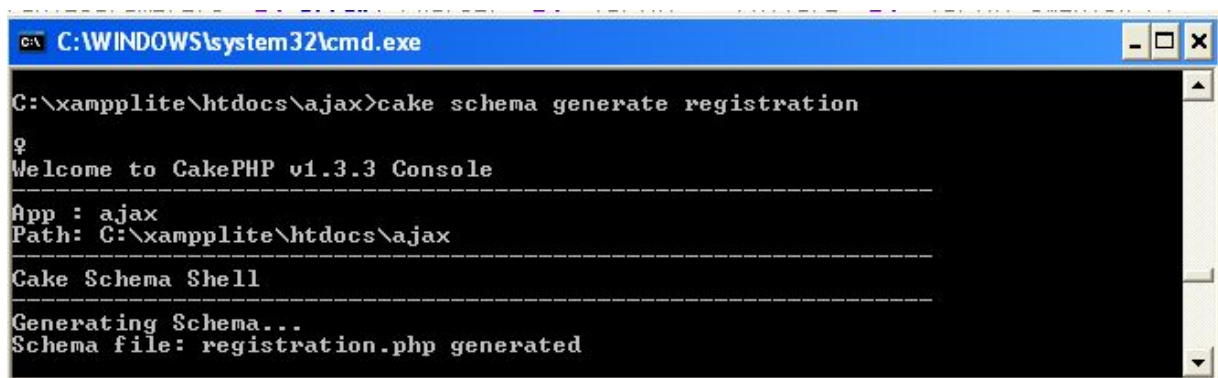

Untuk membina sistem penyusunan Negara-Negeri-Daerah, kita akan menggunakan Tree Behavior

Syarat asas untuk Tree Behavior , bina 3 fields seperti di bawah

- parent - default fieldname is parent\_id, to store the id of the parent object
- left - default fieldname is lft, to store the left value of the current row.
- right - default fieldname is rgt, to store the right value of the current row.

## Cake schema generate registration

Bina fail skema untuk table registration

```
C:\WINDOWS\system32\cmd.exe

C:\xampplite\htdocs\ajax>cake schema generate registration

Welcome to CakePHP v1.3.3 Console
-----
App : ajax
Path: C:\xampplite\htdocs\ajax
-----
Cake Schema Shell
-----
Generating Schema...
Schema file: registration.php generated
```

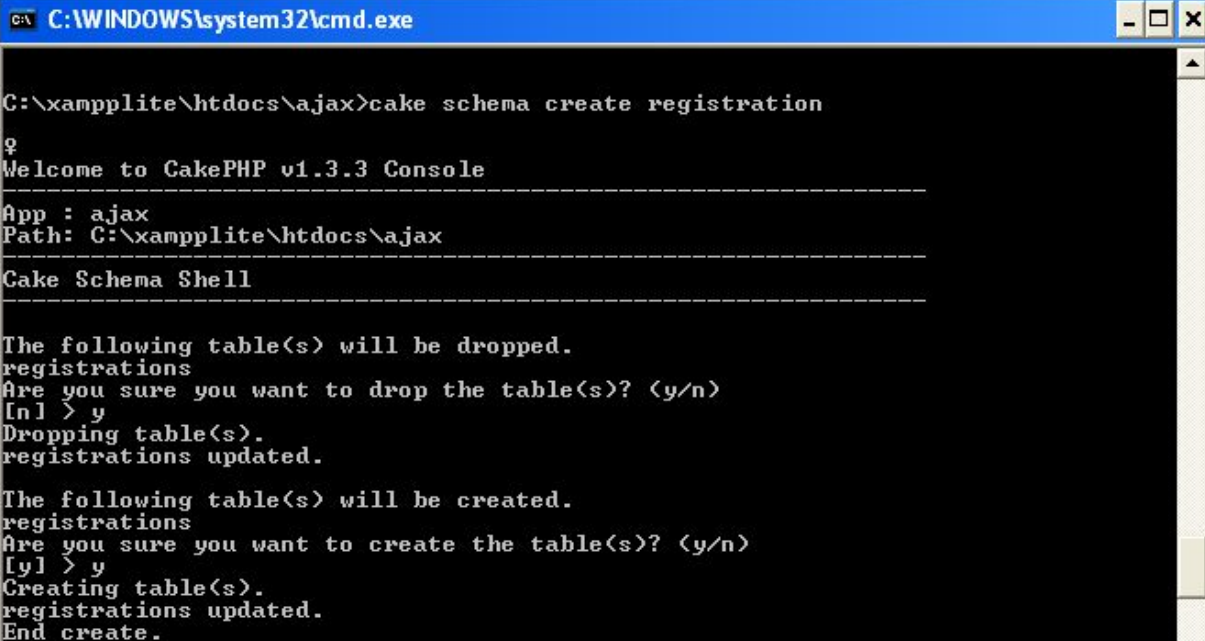

Edit fail APP/config/schema/registration.php dan ubah seperti di bawah :

```

1 <?php
2 /* SVN FILE: $Id$ */
3 /* registration schema generated on: 2010-09-23 12:09:09 : 1285244769*/
4 class registrationSchema extends CakeSchema {
5     var $name = 'registration';
6
7     function before($event = array()) {
8         return true;
9     }
10
11    function after($event = array()) {
12    }
13
14    var $registrations = array(
15        'id' => array('type' => 'integer', 'null' => false, 'default' => NULL, 'key' => 'primary'),
16        'parent_id' => array('type' => 'integer', 'null' => true, 'default' => NULL),
17        'lft' => array('type' => 'integer', 'null' => true, 'default' => NULL),
18        'right' => array('type' => 'integer', 'null' => true, 'default' => NULL),
19        'name' => array('type' => 'string', 'null' => true, 'default' => NULL),
20    );
21 }
22 ?>

```

Kemudian laksanakan arahan di bawah :

```

C:\WINDOWS\system32\cmd.exe

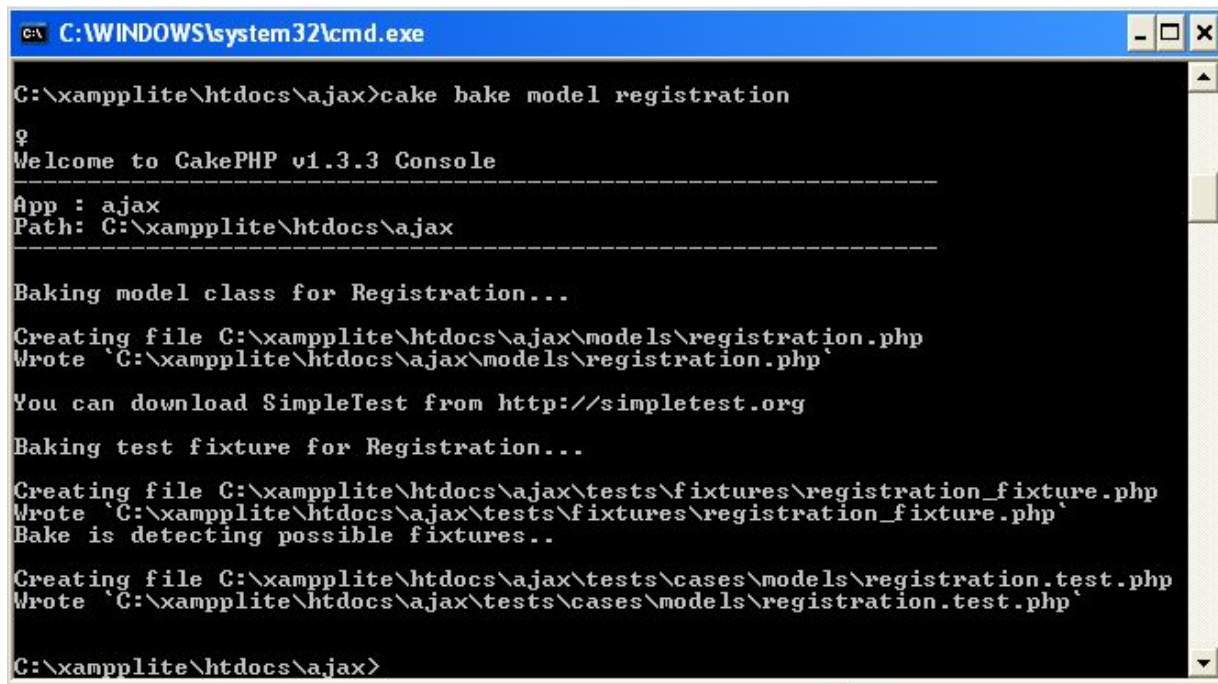

C:\xampplite\htdocs\ajax>cake schema create registration
?
Welcome to CakePHP v1.3.3 Console
-----
App : ajax
Path: C:\xampplite\htdocs\ajax
-----
Cake Schema Shell
-----

The following table(s) will be dropped.
registrations
Are you sure you want to drop the table(s)? (y/n)
[n] > y
Dropping table(s).
registrations updated.

The following table(s) will be created.
registrations
Are you sure you want to create the table(s)? (y/n)
[y] > y
Creating table(s).
registrations updated.
End create.

```

## Bina Model untuk Registration

```

C:\WINDOWS\system32\cmd.exe

C:\xampplite\htdocs\ajax>cake bake model registration

Welcome to CakePHP v1.3.3 Console
-----
App : ajax
Path: C:\xampplite\htdocs\ajax
-----

Baking model class for Registration...

Creating file C:\xampplite\htdocs\ajax\models\registration.php
Wrote 'C:\xampplite\htdocs\ajax\models\registration.php'

You can download SimpleTest from http://simpletest.org

Baking test fixture for Registration...

Creating file C:\xampplite\htdocs\ajax\tests\fixtures\registration_fixture.php
Wrote 'C:\xampplite\htdocs\ajax\tests\fixtures\registration_fixture.php'
Bake is detecting possible fixtures..

Creating file C:\xampplite\htdocs\ajax\tests\cases\models\registration.test.php
Wrote 'C:\xampplite\htdocs\ajax\tests\cases\models\registration.test.php'

C:\xampplite\htdocs\ajax>

```

Edit fail APP/models/registration.php dan letak kod \$actsAs('Tree');

```

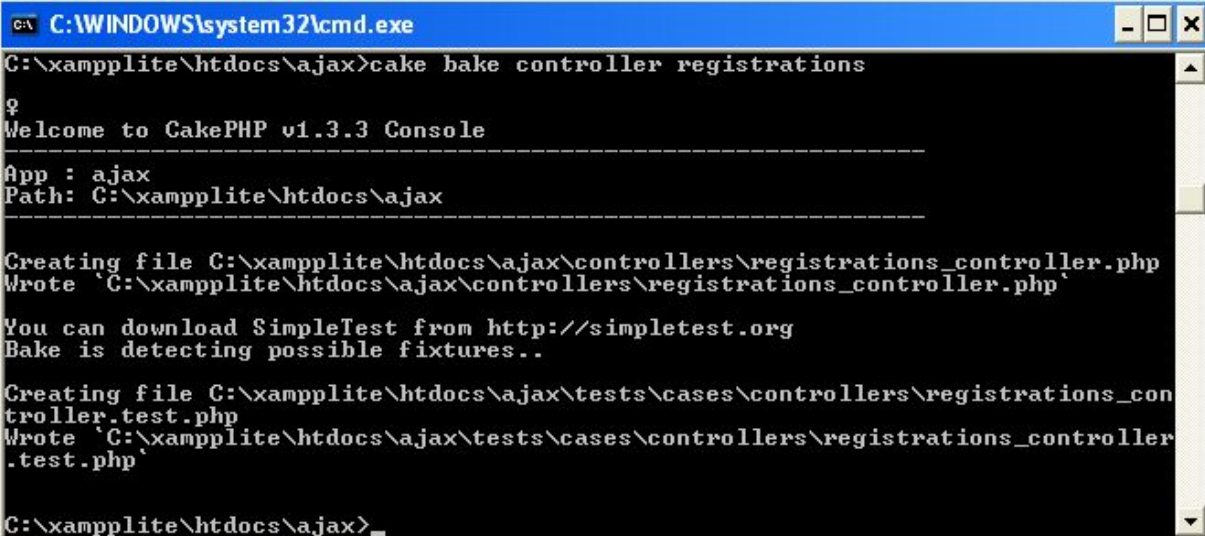

1  <?php
2  class Registration extends AppModel {
3      var $name = 'Registration';
4      var $actsAs = array('Tree');
5  }
6  ?>

```

Left dan right merujuk kepada nama field untuk node lft/rgt dalam table registrations

Generate fail Controller untuk Registrations

```

C:\WINDOWS\system32\cmd.exe
C:\xampplite\htdocs\ajax>cake bake controller registrations
Welcome to CakePHP v1.3.3 Console
-----
App : ajax
Path: C:\xampplite\htdocs\ajax
-----
Creating file C:\xampplite\htdocs\ajax\controllers\registrations_controller.php
Wrote 'C:\xampplite\htdocs\ajax\controllers\registrations_controller.php'
You can download SimpleTest from http://simpletest.org
Bake is detecting possible fixtures..
Creating file C:\xampplite\htdocs\ajax\tests\cases\controllers\registrations_controller.test.php
Wrote 'C:\xampplite\htdocs\ajax\tests\cases\controllers\registrations_controller.test.php'
C:\xampplite\htdocs\ajax>
  
```

Bina rangka actions untuk Registration Controller di APP/controllers/registrations\_controller.php

```

1  <?php
2  class RegistrationsController extends AppController {
3
4      var $name = 'Registrations';
5      //var $scaffold;
6
7      function index() {
8      }
9
10     function add() {
11     }
12
13     function edit() {
14     }
15
16     function delete() {
17     }
18
19 }
20 ?>
  
```

Buat folder registrations di dalam APP/views/

Kita akan bina sistem untuk index dahulu

Advanced CakePHP : CakePHP Ajax Registration Form

Seterusnya, buat action untuk Add, tambah kod berikut di dalam Registration Controller

```

17 function add() {
18     if (!empty($this->data)) {
19         if ($this->Registration->save($this->data)) {
20             $this->Session->setFlash('Data Added');
21             $this->data['Registration']['name'] = '';
22         } else {
23             $this->Session->setFlash('Failed');
24         }
25     }
26     $registrations = $this->Registration->generateTreeList(null, null, null, '___');
27     $this->set('registrations', $registrations);
28 }
29

```

Tambah kod di bawah dan save sebagai APP/views/registrations/add.ctp

```

1 <h2>Registration Management</h2>
2 <div class="index">
3     <fieldset style="margin-top:20px">
4         <legend>Add Data</legend>
5         <?php echo $html->getCrumbs(' > ', 'Home'); ?>
6         <?php echo $form->create('Registration'); ?>
7         <?php echo $form->input('id'); ?>
8         <?php echo $form->input('parent_id', array(
9             'type' => 'select',
10            'options' => $registrations,
11            'empty' => 'ROOT')
12        ); ?>
13        <?php echo $form->input('name'); ?>
14        <?php echo $form->end('Create'); ?>
15    </fieldset>
16 </div>
17
18 <div class="actions">
19     <ul>
20         <li><?php echo $html->link('Home', '/registrations/index'); ?> </li>
21         <li><?php echo $html->link('Add', '/registrations/add'); ?> </li>
22         <li><?php echo $html->link('Delete', '/registrations/delete'); ?> </li>
23     </ul>
24 </div>

```

Seterusnya untuk fungsi edit, tambah kod seperti di bawah :

```
31 function edit() {
32     if(!empty($this->data)){
33         if($this->data['Registration']['update'] == 1){
34             if($this->Registration->save($this->data){
35                 $this->Session->setFlash('Data Updated');
36                 $this->data['Registration']['name'] = '';
37             } else {
38                 $this->Session->setFlash('Failed');
39             }
40             $this->redirect('index');
41         }
42         $this->data = $this->Registration->findById($this->data['Registration']);
43     }
44     $registrations = $this->Registration->generateTreeList(null,null,null, '___');
45     $this->set('registrations', $registrations);
46 }
```

Dan tambah kod berikut sebagai APP/views/registrations/edit.ctp

```

1  <h2>Registration Management</h2>
2  <div class="index">
3  <fieldset style="margin-top:20px">
4  <legend>Choose Data</legend>
5  <?php echo $form->create('Registration'); ?>
6  <?php echo $form->input('id'); ?>
7  <?php echo $form->input('Registration', array(
8      'type' => 'select',
9      'options' => $registrations,
10     'empty' => 'ROOT')
11 ); ?>
12 <?php //debug($this->data);?>
13 <?php if($this->data): ?>
14     <?php echo $form->input('parent_id', array(
15         'type' => 'select',
16         'options' => $registrations,
17         'empty' => 'ROOT')
18     ); ?>
19     <?php echo $form->input('name'); ?>
20     <?php echo $form->hidden('update', array('value' => 1)); ?>
21 <?php endif; ?>
22 <?php echo $form->end('Update'); ?>
23 </fieldset>
24 </div>
25
26 <div class="actions">
27 <ul>
28     <li><?php echo $html->link('Home', '/registrations/index'); ?> </li>
29     <li><?php echo $html->link('Add', '/registrations/add'); ?> </li>
30     <li><?php echo $html->link('Update', '/registrations/edit'); ?> </li>
31     <li><?php echo $html->link('Delete', '/registrations/delete'); ?> </li>
32 </ul>
33 </div>

```

Seterusnya untuk action Delete, sila tambah kod berikut :

```

48 function delete() {
49     if(!empty($this->data)) {
50         if($this->Registration->delete($this->data['Registration']['id'])){
51             $this->Session->setFlash('Data Deleted');
52         } else {
53             $this->Session->setFlash('Failed');
54         }
55         $this->redirect('index');
56     }
57     $registrations = $this->Registration->generateTreeList (null,null,null, '___');
58     $this->set('registrations', $registrations);
59 }
60

```

Dan view untuk delete adalah seperti berikut, APP/views/registrations/delete.ctp

```

1 <h2>Registration Management</h2>
2 <div class="index">
3 <fieldset style="margin-top:20px">
4 <legend>Choose Data</legend>
5 <?php echo $form->create('Registration'); ?>
6 <?php echo $form->input('id'); ?>
7 <?php echo $form->input('Registration', array(
8     'type' => 'select',
9     'options' => $registrations,
10    'empty' => 'ROOT')
11    ); ?>
12 <?php echo $form->end('Delete'); ?>
13 </fieldset>
14 </div>
15
16 <div class="actions">
17 <ul>
18 <li><?php echo $html->link('Home','/registrations/index'); ?> </li>
19 <li><?php echo $html->link('Add','/registrations/add'); ?> </li>
20 <li><?php echo $html->link('Update','/registrations/edit'); ?> </li>
21 <li><?php echo $html->link('Delete','/registrations/delete'); ?> </li>
22 </ul>
23 </div>

```

# Uji sistem

1. Buka alamat <http://localhost/ajax/registrations> dan tambah data
2. Cuba tambah data secara sub-kategori
3. Cuba edit data sedia ada
4. Cuba delete data

Create

Contoh tambah data di bawah Parent Wilayah Persekutuan

## Kesimpulan

Dengan cara menggunakan Tree Behavior, kita dapat membina sistem yang membolehkan kita menyusun data secara dinamik dan mempunyai sub kategori tanpa had. Sistem di atas adalah versi asas, and boleh tambah ciri-ciri berikut seperti :

- Ordering system
- Search System

Kegunaan Tree Behavior yang baru kita cipta ialah untuk menyusun data yang akan digunakan dalam borang pendaftaran seperti

- States
- Sexes
- Religions
- Races

### Registration Management

Add	States
Update	Malaysia
Delete	Wilayah Persekutuan
	Putrajaya
	Labuan
	Sex
	Male
	Female
	Race
	Malay
	Chinese
	Indian
	Religion
	Islam
	Buddha
	Hindu
	Christian

Contoh data yang telah ditambah dan akan digunakan dalam borang pendaftaran

# Borang Pendaftaran Peserta

Borang yang akan kita bina akan mempunyai ciri-ciri berikut

- Setiap fields akan mempunyai beberapa validations seperti
  1. fullname tidak kurang dari 5 dan tidak lebih dari 20 aksara
  2. email mesti dalam format yang betul
  3. No NRIC dalam format yang betul
  4. nickname tidak boleh duplicate
  5. pilihan secara dinamik untuk Negara, Negeri dan Daerah
  6. Dropdown untuk agama,bangsa dan jantina

Seterusnya, kita akan cipta skema bernama subscriber. Menggunakan Cake CLI cipta skema tersebut

```
C:\xampplite\htdocs\ajax>cake schema generate subscriber
Welcome to CakePHP v1.3.3 Console
-----
App : ajax
Path: C:\xampplite\htdocs\ajax
-----
Cake Schema Shell
-----
Generating Schema...
Schema file: subscriber.php generated
C:\xampplite\htdocs\ajax>
```

Edit fail APP/config/schema/subscriber.php seperti berikut

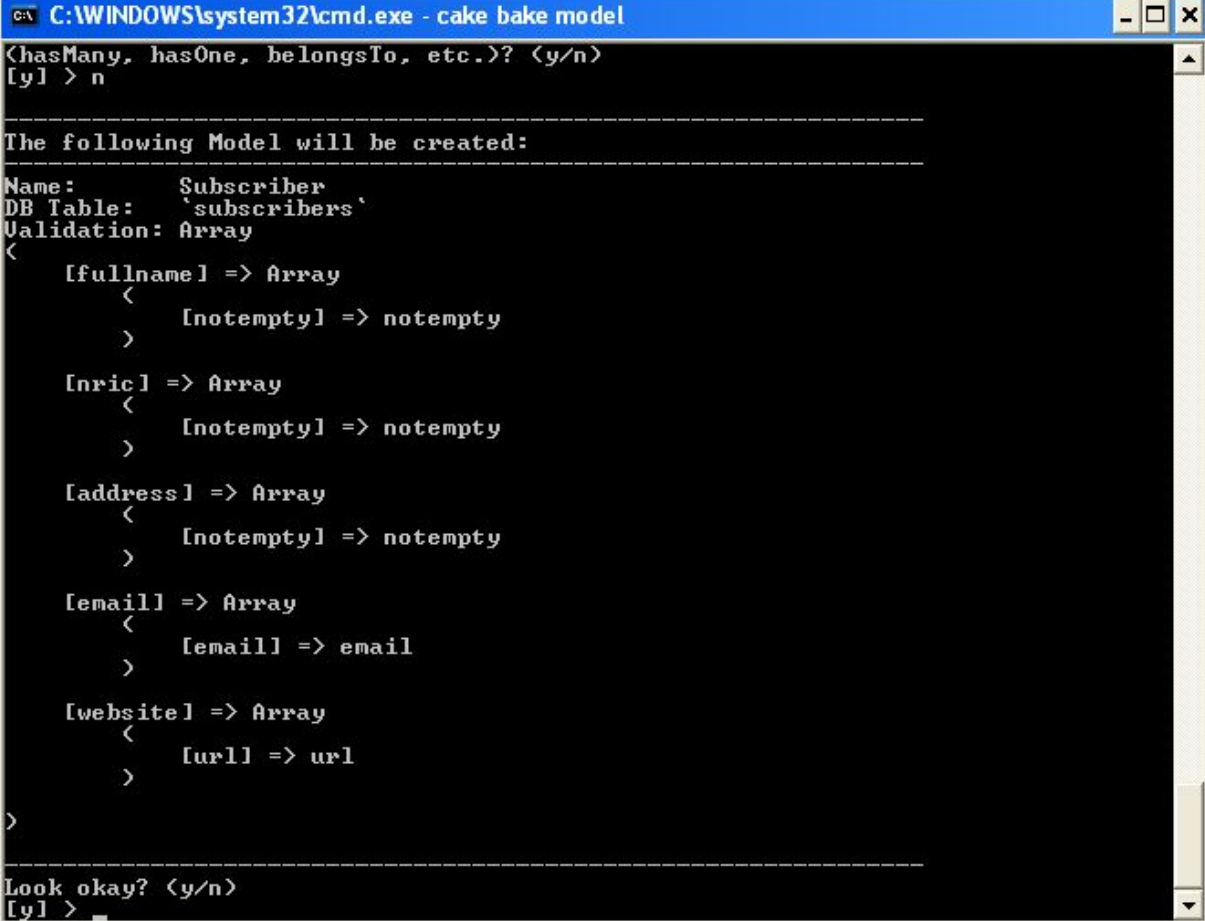

```

1 <?php
2 /* SVN FILE: $Id$ */
3 /* subscriber schema generated on: 2010-09-24 15:09:32 : 1285340432 */
4 class subscriberSchema extends CakeSchema {
5     var $name = 'subscriber';
6
7     function before($event = array()) {
8         return true;
9     }
10
11    function after($event = array()) {
12    }
13
14    var $subscribers = array(
15        'id' => array('type' => 'integer', 'null' => false, 'default' => NULL, 'key' => 'primary'),
16        'fullname' => array('string', 'null' => true, 'default' => NULL),
17        'nric' => array('string', 'null' => true, 'default' => NULL),
18
19        'address' => array('string', 'null' => true, 'default' => NULL),
20        'geocoded' => array('tinyint', 'null' => true, 'default' => 0),
21        'lng' => array('string', 'null' => true, 'default' => NULL),
22        'lat' => array('string', 'null' => true, 'default' => NULL),
23
24        'country' => array('string', 'null' => true, 'default' => NULL),
25        'state' => array('string', 'null' => true, 'default' => NULL),
26        'district' => array('string', 'null' => true, 'default' => NULL),
27
28        'race' => array('string', 'null' => true, 'default' => NULL),
29        'gender' => array('string', 'null' => true, 'default' => NULL),
30        'religion' => array('string', 'null' => true, 'default' => NULL),
31
32        'email' => array('type' => 'string', 'null' => true, 'default' => NULL),
33        'website' => array('string', 'null' => true, 'default' => NULL),
34    );
35 }
36
37 ?>

```

PasteBin : <http://pastebin.com/4efnT6Hq>

Kemudian jalan kan arahan cake bake model ( pilih model Subscriber dan tetapkan validation seperti berikut )

```
C:\WINDOWS\system32\cmd.exe - cake bake model
<hasMany, hasOne, belongsTo, etc.>? <y/n>
[y] > n

-----
The following Model will be created:
-----
Name:      Subscriber
DB Table:  'subscribers'
Validation: Array
<
  [fullname] => Array
  <
    [notEmpty] => notempty
  >
  [nrict] => Array
  <
    [notEmpty] => notempty
  >
  [address] => Array
  <
    [notEmpty] => notempty
  >
  [email] => Array
  <
    [email] => email
  >
  [website] => Array
  <
    [url] => url
  >
>

-----
Look okay? <y/n>
[y] >
```

PasteBin : <http://pastebin.com/qdg3ZCBF>

Kita akan menggunakan Registrations Controller dan menggunakan action baru bernama 'form'.  
Letak kod berikut di dalam APP/controllers/registrations\_controller.php

```

62 function form(){
63     $this->LoadModel('Subscriber');
64
65     // $options from dropdown menu
66     $countries = $this->__options('States');
67     $religions = $this->__options('Religion');
68     $races = $this->__options('Race');
69     $sexes = $this->__options('Sex');
70     $this->set(compact('countries','religions','races','sexes'));
71
72 }
73
74 // $options generator
75 function __options($name = null){
76     // dropdown from states
77     $parent = $this->Registration->findByName($name);
78     $options = $this->Registration->children($parent['Registration']['id'], $direct = true);
79     return Set::combine($options, '{n}.Registration.name', '{n}.Registration.name');
80 }

```

PasteBin : <http://pastebin.com/hgZggiwd>

Buat 2 actions, form() dan \_\_options(). Fungsi private function options() ialah untuk generate array() dalam format yang betul untuk digunakan oleh Form::select() Helper.

Seterusnya bina fail APP/views/registrations/form.ctp dan letak kod berikut :

```

1 <fieldset>
2     <legend>Registration Form</legend>
3     <?php echo $form->create('Registration'); ?>
4     <?php echo $form->input('fullname'); ?>
5     <?php echo $form->input('nric'); ?>
6
7     <?php echo $form->input('address'); ?>
8
9     <?php echo $form->input('email'); ?>
10    <?php echo $form->input('website'); ?>
11    <?php echo $form->input('country', array(
12        'type' => 'select',
13        'options' => $countries,
14        'empty' => 'Select Country')
15    ); ?>
16
17    <?php echo $form->input('race', array(
18        'type' => 'select',
19        'options' => $races,
20        'empty' => 'Select Race')
21    ); ?>
22
23    <?php echo $form->input('religion', array(
24        'type' => 'select',
25        'options' => $religions,
26        'empty' => 'Select Religion')
27    ); ?>
28
29    <?php echo $form->input('gender', array(
30        'type' => 'select',
31        'options' => $sexes,
32        'empty' => 'Select Gender')
33    ); ?>
34
35
36    <?php echo $form->end('Register'); ?>
37 </fieldset>

```

PasteBin : <http://pastebin.com/zeHVxE5t>

Ralat : Gantikan \$form->create() dgn kod di bawah:

```

4     <?php echo $form->create('Subscriber',
5         array('url' =>
6             array(
7                 'controller' => 'registrations',
8                 'action' => 'form'
9             ));
10    ?>

```

Advanced CakePHP : CakePHP Ajax Registration Form

Uji sistem pendaftaran di <http://localhost/ajax/registrations/form>

CakePHP: the rapid development php framework

### Registration Form

Fullname

Nric

Address

Email

Website

Country  
Select Country ▼

Race  
Select Race ▼  
Select Race  
Malay  
Chinese  
Indian

Gender  
Select Gender ▼

Register

Saya menggunakan Select Form untuk data Country,Race,Religion dan Gender. Kesemua data tersebut dikawal oleh TreeBehavior yang digunakan dalam model Registration.

Tambah kod berikut di dalam Registrations Controller

```

124 // ajax validator
125 function validator(){
126     $this->autoRender = FALSE;
127     $this->LoadModel('Subscriber');
128
129     if (!$this->Subscriber->save($this->data, array('validate' => 'only'))) {
130         $error = $this->Subscriber->invalidFields();
131         list($key, $value) = each ($error);
132         echo "<div class='error-message'>$value</div>";
133     }
134 }
135
136
137 // geocode address
138 function __geocode($address = null){
139     $address = urlencode(stripslashes($address));
140     $location = @file("http://maps.google.com/maps/geo?q=$address&output=csv");
141
142     // Sample - $location[0]="200,8,51.369318,-2.133457";
143     list ($status,$accuracy,$lng,$lat) = explode(',',$location[0]);
144     if($status == 200){
145         $location['lng'] = $lng;
146         $location['lat'] = $lat;
147         return $location;
148     } else {
149         return FALSE;
150     }
151 }

```

Validator() ~ digunakan untuk validate single field menggunakan AJAX

\_\_geocode() ~ untuk dapatkan nilai Longitude dan Latitude dari alamat yang diberi

Tambah Helper dan Component untuk membolehkan Ajax berfungsi

```

1 <?php
2 class RegistrationsController extends AppController {
3
4     var $name = 'Registrations';
5     //var $scaffold;
6     var $components = array('RequestHandler');
7     var $helpers = array('Ajax');
8

```

Tambah kod di bawah di dalam Registration Controller

```

82 // geocode given address
83 function getCoordinate(){
84     if( $coords = $this->__geocode($address = $this->data['Subscriber']['address']) ){
85         $this->set('coords', $coords);
86     } else {
87         $this->autoRender = FALSE;
88         echo 'Cannot get coordinate';
89     }
90 }

```

Action getCoordinate() akan digunakan oleh Ajax untuk mendapatkan kordinat Subscriber

Seterusnya letak kod berikut sebagai View untuk getCoordinate,  
APP/views/registrations/get\_coordinate.ctp

```

1 <table style="width:400px">
2 <tr>
3     <th>Longitude</th>
4     <th>Latitude</th>
5 </tr>
6 <tr>
7     <td><?php echo $coords['lng'];?></td>
8     <td><?php echo $coords['lat'];?></td>
9 </tr>
10 </table>
11 <?php
12 echo $form->hidden('Subscriber.lng', array('value' => $coords['lng']));
13 echo $form->hidden('Subscriber.lat', array('value' => $coords['lat']));
14 ?>

```

Letak kod berikut di dalam Registrations Controller

```

92 // generate state based on given id
93 function getState(){
94     //debug($this->data);
95     if('empty'($this->data['Subscriber']['country'])){
96         $states = $this->__options($this->data['Subscriber']['country']);
97     } else {
98         $states = null;
99     }
100     $this->set('states', $states);
101 }
102 // generate district based on given id
103 function getDistrict(){
104     if('empty'($this->data['Subscriber']['state'])){
105         $districts = $this->__options($this->data['Subscriber']['state']);
106     } else {
107         $districts = null;
108     }
109     $this->set('districts', $districts);
110 }

```

getState() digunakan untuk mendapatkan nilai States berdasarkan Country, dan getDistrict() akan dapatkan nilai Districts berdasarkan nilai State yang diberi. Seterusnya untuk getState() View, letak kod berikut,

```

1 <?php
2 $state = $form->input('Subscriber.state', array(
3     'type' => 'select',
4     'options' => $states,
5     'empty' => 'Select State',
6     'label' => false
7 ));
8
9 $state_ajax = $ajax->observeField('SubscriberState',
10     array(
11         'url' => array('action' => 'getDistrict'),
12         'frequency' => 0.2,
13         'indicator' => 'loader',
14         'update' => 'district'
15     )
16 );
17 echo $state;
18 echo $state_ajax;
19 ?>

```

APP/views/registrations/get\_state.ctp

Dan VIEW untuk getDistrict() pula seperti berikut :

```

1  <?php
2  $district = $form->input('Subscriber.district', array(
3      'type' => 'select',
4      'options' => $districts,
5      'empty' => 'Select District',
6      'label' => false
7  )
8  );
9  echo $district;
10 ?>

```

APP/views/registrations/get\_district.ctp

```

67  function form() {
68      $this->loadModel('Subscriber');
69      if($this->data) {
70          if($this->Subscriber->save($this->data) {
71              }
72          }
73
74      // $options from dropdown menu
75      $countries = $this->__options('States');
76      $religions = $this->__options('Religion');
77      $races = $this->__options('Race');
78      $sexes = $this->__options('Sex');
79      $this->set(compact('countries', 'religions', 'races', 'sexes'));
80  }

```

Ubah kod untuk action form() seperti di atas.

Kod untuk APP/views/registrations/form.ctp adalah seperti berikut,

```

1 <fieldset>
2 <legend>Registration Form &nbsp;  </legend>
3
4 <span id="loader" style="display:none">
5 <?php echo $this->Html->image('loader.gif'); ?>
6 </span>
7 </legend>
8
9 <?php echo $form->create('Subscriber',
10 array('url' =>
11 array(
12 'controller' => 'registrations',
13 'action' => 'form'
14 ));
15 ?>
16
17 <?php echo $form->input('fullname'); ?>
18 <div id="fullname_error"></div>
19 <?php
20 echo $ajax->observeField( 'SubscriberFullname',
21 array(
22 'url' => array( 'action' => 'validator' ),
23 'frequency' => 0.2,
24 'indicator' => 'loader',
25 'update' => 'fullname_error'
26 )
27 );
28 ?>
29 <?php echo $form->input('nric'); ?>
30 <div id="nric_error"></div>
31 <?php
32 echo $ajax->observeField( 'SubscriberNric',
33 array(
34 'url' => array( 'action' => 'validator' ),
35 'frequency' => 0.2,
36 'indicator' => 'loader',
37 'update' => 'nric_error'
38 )
39 );
40 ?>

```

```

41
42     <?php echo $form->input('address'); ?>
43     <div id="address_error"></div>
44     <?php
45         echo $ajax->observeField( 'SubscriberAddress',
46             array(
47                 'url' => array( 'action' => 'getCoordinate' ),
48                 'frequency' => 0.2,
49                 'indicator' => 'loader',
50                 'update' => 'address_error'
51             )
52         );
53     ?>
54
55
56     <?php echo $form->input('email'); ?>
57     <div id="email_error"></div>
58     <?php
59         echo $ajax->observeField( 'SubscriberEmail',
60             array(
61                 'url' => array( 'action' => 'validator' ),
62                 'frequency' => 0.2,
63                 'indicator' => 'loader',
64                 'update' => 'email_error'
65             )
66         );
67     ?>
68
69
70     <?php echo $form->input('website'); ?>
71     <div id="website_error"></div>
72     <?php
73         echo $ajax->observeField( 'SubscriberWebsite',
74             array(
75                 'url' => array( 'action' => 'validator' ),
76                 'frequency' => 0.2,
77                 'indicator' => 'loader',
78                 'update' => 'website_error'
79             )
80         );
81     ?>

```

```

82 <?php
83 $country = $form->input('country', array(
84     'type' => 'select',
85     'options' => $countries,
86     'empty' => 'Select Country',
87     'label' => false
88 ));
89
90 $country_ajax = $ajax->observeField( 'SubscriberCountry',
91     array(
92         'url' => array( 'action' => 'getState' ),
93         'frequency' => 0.2,
94         'indicator' => 'loader',
95         'update' => 'state'
96     )
97 );
98
99
100 $state = $form->input('state', array(
101     'type' => 'select',
102     'options' => array(),
103     'empty' => '',
104     'label' => false,
105
106 ));
107
108 $district = $form->input('district', array(
109     'type' => 'select',
110     'options' => array(),
111     'empty' => '',
112     'label' => false
113 ));
114
115
116 ?>

```

```

118 <table style="width: 600px;">
119 <tr>

Kesemua error di atas dihasilkan secara automatik menggunakan AJAX.

### Latihan

1. Bina kod untuk ekstrak data dari NRIC dan paparkan data yang diperolehi di dalam HTML Table
2. Cuba embed Google Map mengikut koordinat yang diperolehi menggunakan IFRAME
3. Ubahsuai supaya Form dihantar menggunakan AJAX dan terus paparkan maklumat selepas berjaya hantar
4. Tambah validation supaya jika user tidak memilih nilai DropDown akan hasilkan ERROR
